ABSTRACT

The Aviation and Space Dictionary is the second of a series of Chinese-English technical dictionaries under preparation by the Foreign Technology Division, United States Air Force Systems Command. The purpose of the series is to provide rapid reference tools for translators, abstracters, and research analysts concerned with scientific and technical materials from Mainland China. This dictionary contains about 28,000 terms selected from sources published in Mainland China. The terms in this dictionary also incorporate those from Aviation and Space, Volume I, compiled at the Library of Congress. They relate not only to general aviation, aeronautical engineering, rocket engines, astronavigation, etc., but also incorporate vocabulary from the basic sciences and the auxiliary technologies closely associated with aviation and space, such as, telecommunications, metallurgy, welding, and aircraft construction. An alphabetic lookup system based on the "pinyin" spelling of Modern Standard Chinese is provided, as well as a character index for users less familiar with the pinyin system. (Author/CLK)

FOREWORD

The Aviation and Space Dictionary is the second of a series of Chinese-English technical dictionaries under preparation by the Foreign Technology Division, United States Air Force Systems Command. The purpose of the series is to provide rapid reference tools for translators, abstracters, and research analysts concerned with scientific and technical materials from Mainland China. This dictionary contains about 28,000 terms selected from sources published in Mainland China. The terms included relate not only to general aviation, aeronautical engineering, rocket engines, astronavigation, etc., but incorporate vocabulary from the basic sciences and the auxiliary technologies closely associated with aviation and space, such as, telecommunications, metallurgy, welding, aircraft construction, etc.

The special features of this dictionary are Mainland Chinese practice in regard to: (1) terminology, (2) style of characters, (3) complete alphabetic lookup by means of the "pinyin" spelling. Characters in some of the terms have been regrouped for optimum clearness and suitability for computer processing.

The terms in this dictionary also incorporate those from Aviation and Space, Volume I, compiled at the Library of Congress. Other subject areas in the series will cover general and nuclear physics, electronics and telecommunications, rocketry, automation and computer technology, surveying, mapping, and meteorology.

ARRANGEMENT OF CHINESE ENTRIES

The Chinese written language is undergoing an evolution toward simpler forms, i.e., individual characters with reduced numbers of strokes. This process is in effect eroding the traditional classification of a character by its radical with a fixed number and the residual stroke count. As a result Chinese-English dictionaries published in Mainland China and elsewhere are resorting to a system of alphabetic lookup. The basis of this system is the "pinyin" spelling of Modern Standard Chinese as established in Mainland China. With a standardized spelling, a Chinese dictionary now resembles more nearly one of an alphabetic language.

In the dictionaries of this series, the Chinese entries are ordered in accordance with the transcription of the first character of the term. Homophones are arranged in order by syllable, tones 1 to 4, total stroke count, radical, and residual strokes. Succeeding syllables of an entry are in alphabetic order and where homophones in second place occur the one with the lower stroke count precedes.

A character index is provided for users less familiar with the pinyin spelling. It is a "total stroke" index with a visual radical column, the purpose of which is to eliminate tedious and time-consuming radical identification and subsequent counting of residual strokes before locating the desired character. A character located in the INDEX refers the reader to the page where terms beginning with this character are listed.

It is confidently expected that the presentation of Chinese technical terminology in an alphabetic lookup system will reduce access time for Chinese dictionaries to that of any other alphabetic language.
